Guide to the microform collection
IDC number BT-16

 **IDC** 1995

Prepared by Robert J. Soreng, Paul M. Peterson and Carol Annable, June 1994.

Funding for this project was provided by the James Smithson Society, Smithsonian Institution.

Assistance with the project was provided by the staff of the Komarov Botanical Institute - V. Byalt, V. Dorofeev, D. Geltman, A. Grabovskaya, L. Krupkina.

The catalogue represents an enumeration of specimens in the C. B. Trinius Gramineae Herbarium at LE. The collection represents Trinius' personal grass herbarium which was donated to the Imperial Academy of Sciences, St. Petersburg, in 1841, and later inherited by the Botanic Garden of Saint-Petersburg (subsequently renamed the V. L. Komarov Botanical Institute). In the collection there are a total of 3,281 folders and about 10,700 sheets. Roughly ten percent of the sheets contain types, often with original drawings used for illustrations in Trinius' publications. The collection has been maintained as a unit, and has been little disturbed by curation or addition of material since Trinius's time (1778-1844). A. S. Hitchcock is known to have studied the collection in about 1907 when he collected many type fragments for the Smithsonian Institution. The order of genera in the collection follows Trinius' classification of the grasses. Within genera species names are mostly alphabetically arranged. The specimens are arranged in folders bearing names which principally are written in Trinius' hand. The names on the folders principally are of those taxa which he recognized. Specimens of taxa he considered as synonyms, including types, are included within the folders of the recognized taxon. The name given for each sheet in the catalogue is that written on the specimen folder in which it was filed, and not necessarily the name on the sheet itself.

Some of the principal collectors represented are G. H. von Langsdorff, L. Riedel, D. Mertens, and L. A. von Chamisso. Also there is an extensive set of exsiccatae, including many types, from C. G. Nees von Esenbeck whose primary grass herbarium was later destroyed in Berlin.

An asterisk proceeding a name indicates that name was not found in either Kew Index or the Index to Grass Species (Chase and Niles, 1961), and therefore may be unpublished. All other names have been verified in the previous sources or original literature, though many are illegitimate or invalid. A list of full names (including the author, though this was not always clear as in some cases there was a possible discrepancy in application, or there were multiple authors for the same Latin name included in one folder) is available from the authors of the Catalogue. The catalogue numbers represent the sequential folder number first, and the sequential specimen number within the folder second (e.g.; 0001.01 is the first folder, and the first specimen in that folder). Where there has been an occasional duplication of folder numbers, these have been identified as series "a" and "b".

Most of the type specimens in the herbarium have been identified (est. 80-90%). For these the label data and the catalogue number are available in TROPICOS (the Missouri Botanical Garden's taxonomic data base).
